

Figure 2: Evaluation of infection frequency in individual plants from different populations.

Each individual facet shows different populations (as tested in Figure 1) each box plot shows a single plant tested for infection phenotype. Experiments were performed on three separate dates (with an exception for 1 plant only on two dates), each time with 8 leaves per plant (with an exception in 2 plants with 7 leaves per plant). Y-axis represents infection frequency and X-axis represents different plants; color shows the geographical region of the population (as in Figure 1).
